**Table S1 S1.** Main data on the 11 ancient skeletons. Place: place of burial; Elevation: elevation al Geographical: geographical coordinates; Excavation: year of excavation; Dating: dating of the skeleton historical and archaeological records; Coffin: presence in coffin; Storage condition: storage conditions skeletons were discovered in non-disturbed individual graves and, after excavation, the bone remains w dried, and analyzed by a physical anthropologist. Based on the archaeological context and anthropologic each grave were attributed to one individual. After anthropological analysis, the remains were placed in a museum storeroom under dark, dry, cold, and stable conditions until this study. These skeletons were date anthropological records from the 3rd to 18th century AD.

**Table S2.** Quantification data of the 47 bone element types selected from the 11 ancient skeletons and the 24 WWII skulls obtained using the PowerQuant System (average values from duplicate tests). Raw data were obtained using the ABI 7500 Real-Time PCR System (Applied Biosystems, AB, Foster City, CA, USA), and the results were then converted using PowerQuant Analysis Tool software ([www.promega.com/resources/tools/powerquantanalysis-tool](http://www.promega.com/resources/tools/powerquantanalysis-tool)). The imported data were then used to evaluate standard curves (acceptable  $r^2$  and slope values), to determine quantities of Auto (Autosomal), Deg (Degradation), and Y targets in the samples, and to calculate the [Auto]/[Deg] ratio together with the IPC (Internal Positive Control) shift value. When the Deg probe gave no Cq, the degradation level was assumed to be as “un-calculable” (u-c in the Table).

**Table S4.** Main PCR parameters (amount of template DNA and number of cycles) and sequencing parameters (mapped reads, on target (%), mean depth, uniformity (%)) of the bone samples from the 11 ancient skeletons and the 24 WWII skulls. The eight samples that gave no reads above 20× of coverage are in **red characters**. The BAM file analysis of these eight libraries allowed the identification of similarity with *Arthospira platensis* (A) and *Taylorella equigenitalis* (T) (see column I).

**Table S9.** Results of the genetic typing of skeleton 1.

The list order of SNP markers refers to the list order used in the HiIrisPlex-S webtool (<https://hirisplex.erasmusmc.nl/>).

In case of three-allelic pattern, the dropped-in allele is in **bold red** characters.

Less-covered alleles are shown in **green bold characters** in the case of allelic imbalance (e.g., A**C**).

Flags allerting noising reads (1-10 % of the total) are shown in square brackets [].

Allelic drop-outs are shown in blue boxes.

**NA**= not available for phenotypic prediction.

**Table S9.** Results of the genetic typing of skeleton 6.

The list order of SNP markers refers to the list order used in the HIrisPlex-S webtool (<https://hirisplex.erasmusmc.nl/>).

In case of three-allelic pattern, the dropped-in allele is in **bold red** characters.

Less-covered alleles are shown in **green bold characters** in the case of allelic imbalance (e.g., A**C**).

Flags alerting noising reads (1-10 % of the total) are shown in square brackets [].

Allelic drop-outs are shown in blue boxes.

**NA**= not available for phenotypic prediction.
