

Supplement File 1.

Item category & checklist	Explanation	Section
Design	Describe survey design	Describe target population, sample frame. Is the sample a convenience sample? (In "open" surveys this is most likely)
	IRB approval	Mention whether the study has been approved by an IRB
	Informed consent	Describe the informed consent process. Where were the participants told the length of time of the survey, which data were stored and where and for how long, who the investigator was, and the purpose of the study?
	Data protection	If any personal information was collected or stored, describe what mechanisms were used to protect unauthorized access
Development and pre-testing	State how the survey was developed, including whether the usability and technical functionality of the electronic questionnaire had been tested before fielding the questionnaire	Questionnaire creation and structure
Development and testing	State how the survey was developed, including whether the usability and technical functionality of the electronic questionnaire having access to the questionnaire	Questionnaire creation and structure
Recruitment process and description of the sample	An "open survey" is a survey open for each visitor of a site, while a closed survey is only open to a sample which the investigator knows (password-protected survey)	Questionnaire dissemination
Open survey versus closed survey	Indicate whether or not the initial contact with the potential participants was made on the Internet (Investigators may also send out questionnaires by mail and allow for Web-based data entry)	Questionnaire dissemination
Contact mode	How/where was the survey announced or advertised? Some examples are offline media (newspapers), or online (mailing lists—if yes, which ones?) or banner ads. (Where were these banner ads posted and what did they look like?). It is important to know the wording of the announcement as it will heavily influence who chooses to participate. Ideally the survey announcement should be published as an appendix	Questionnaire dissemination
Advertising the survey	State the type of e-survey (e.g., one posted on a Web site, or one sent out through e-mail). If it is an e-mail survey, were the responses entered manually into a database, or was there an automatic method for capturing responses?	Data collection and analysis
Survey administration	Describe the Web site (for mailing list/newsgroup) in which the survey was posted. What is the Web site about, who is visiting it, what are visitors normally looking for? Discuss to what degree the content of the Web site could pre-select the sample or influence the results. For example, a survey about vaccination on an anti-immunization Web site will have different results from a Web survey conducted on a government Web site	Questionnaire dissemination
Web/e-mail	Was it a mandatory survey to be filled in by every visitor who wanted to enter the Web site, or was it a voluntary survey?	Questionnaire dissemination
Context	Were any incentives offered (e.g., monetary prizes, or non-monetary incentives such as an offer to provide the survey results)?	Not applicable
Mandatory/voluntary	In what timeframe were the data collected?	Questionnaire dissemination
Incentives	To prevent biases items can be randomized or alternated	Not applicable
Time/date	Use adaptive questioning (certain items, or only conditionally displayed based on responses to other items) to reduce number and complexity of the questions	Not applicable
Randomization of items or questionnaires	What was the number of questionnaire items per page? The number of items is an important factor for the completion rate	Questionnaire creation and structure
Adaptive questioning		
Number of Items		

Item category & checklist	Explanation	Section
Number of screens (pages)	Over how many pages was the questionnaire distributed? The number of items is an important factor for the completion rate	Questionnaire creation and structure
Completeness check	<p>It is technically possible to do consistency or completeness checks before the questionnaire is submitted. Was this done, and if "yes", how (usually JavaScript)? An alternative is to check for completeness after the questionnaire has been submitted (and highlight mandatory items). If this has been done, it should be reported. All items should provide a non-response option such as "not applicable" or "rather not say", and selection of one response option should be enforced</p> <p>State whether respondents were able to review and change their answers (e.g., through a Back button or a Review step which displays a summary of the responses and asks the respondents if they are correct)</p>	Questionnaire creation and structure
Review step	Review step	Questionnaire creation and structure
Response rates	<p>If you provide view rates or participation rates, you need to define how you determined a unique visitor. There are different techniques available, based on IP addresses or cookies or both</p> <p>Requires counting unique visitors to the first page of the survey, divided by the number of unique site visitors (not page views!). It is not unusual to have view rates of less than 0.1% if the survey is voluntary</p> <p>Count the unique number of people who filled in the first survey page (or agreed to participate, for example by checking a checkbox), divided by visitors who visit the first page of the survey (or the informed consents page, if present). This can also be called "recruitment" rate</p> <p>The number of people submitting the last questionnaire page, divided by the number of people who agreed to participate (or submitted the first survey page). This is only relevant if there is a separate "informed consent" page or if the survey goes over several pages. This is a measure for attrition. Note that "completion" can involve leaving questionnaire items blank. This is not a measure for how completely questionnaires were filled in (If you need a measure for this, use the word "completeness rate")</p>	Not applicable
Unique site visitor		
View rate (ratio of unique survey visitors/unique site visitors)		Not applicable
Participation rate (ratio of unique visitors who agreed to participate/unique first survey page visitors)		Not applicable
Completion rate (ratio of users who finished the survey/users who agreed to participate)		Not applicable
Preventing multiple entries from the same individual	<p>Indicate whether cookies were used to assign a unique user identifier to each client computer. If so, mention the page on which the cookie was set and read, and how long the cookie was valid. Were duplicate entries avoided by preventing users access to the survey twice; or were duplicate database entries having the same user ID eliminated before analysis? In the latter case, which entries were kept for analysis (e.g., the first entry or the most recent)?</p> <p>Indicate whether the IP address of the client computer was used to identify potential duplicate entries from the same user. If so, mention the period of time for which no two entries from the same IP address were allowed (e.g., 24 hours). Were duplicate entries avoided by preventing users with the same IP address access to the survey twice; or were duplicate database entries having the same IP address within a given period of time eliminated before analysis? If the latter, which entries were kept for analysis (e.g., the first entry or the most recent)?</p>	Not applicable
Cookies used		
IP check		
Log file analysis	Indicate whether other techniques to analyze the log file for identification of multiple entries were used. If so, please describe	Not applicable
Registration	In "closed" (non-open) surveys, users need to login first and it is easier to prevent duplicate entries from the same user. Describe how this was done. For example, was the survey never displayed a second time once the user had filled it in, or was the username stored together with the survey results and later eliminated? If the latter, which entries were kept for analysis (e.g., the first entry or the most recent)?	Questionnaire creation and structure

Supplement File 1. Continued 2	Item category & checklist	Explanation	Section
Analysis	Handling of incomplete questionnaires	Were only completed questionnaires analyzed? Were questionnaires which terminated early (where, for example, users did not go through all questionnaire pages) also analyzed? Some investigators may measure the time people needed to fill in a questionnaire and exclude questionnaires that were submitted too soon. Specify the timeframe that was used as a cut-off point, and describe how this point was determined	Data collection and analysis
Questionnaires submitted with an atypical timestamp	Statistical correction	Indicate whether any methods such as weighting of items or propensity scores have been used to adjust for the non-representative sample; if so, please describe the methods	Not applicable
			Not applicable
