Figure S1. Event-Free Survival Across Adjacent RoMa Risk Groups.

The figure displays Kaplan–Meier curves comparing event-free survival among RoMa groups. The left panel compares RoMa II vs. RoMa III, the middle panel RoMa II vs. RoMa IV, and the right panel RoMa III vs. RoMa IV. In all three comparisons, the survival curves show only modest divergence, and none of the differences reached statistical significance based on log-rank tests ($p = 0.47$, $p = 0.22$, and $p = 0.65$, respectively). Vertical dashed lines mark 3-, 5-, and 8-years of follow-up. While there is a trend toward decreased survival with increasing RoMa stage, these pairwise comparisons between intermediate-to-advanced groups did not show significant differences.
