Questa collana di rapporti è iniziata nel 1986 per documentare l'attività svolta all'Università di Trieste nel campo dell'oceanografia e della meteorologia. Nel corso degli anni ci sono stati dei cambiamenti nella denominazione:

| | |
|-----------------|---|
| FTC (1986-1990) | Cattedra di Fisica Terrestre e Climatologia, Facoltà di Scienze |
| LC (1990-1992) | Laboratorio di Climatologia, Dipartimento di Fisica Teorica |
| OM (1993-1995) | Sezione di Oceanografia e Meteorologia, Istituto di Geodesia e Geofisica |
| OM (1996-2009) | Sezione di Oceanografia e Meteorologia, Dipartimento di Scienze della Terra |
| OM (dal 2010) | Sezione di Oceanografia e Meteorologia, Dipartimento di Geoscienze |

Nel 1996 l'Istituto di Geodesia e Geofisica (IGG) e l'Istituto di Mineralogia e Petrografia hanno formato il Dipartimento di Scienze della Terra (DST). Con il 2010 i dipartimenti di Scienze della Terra e di Scienze Geologiche, Ambientali e Marine (DISGAM) si sono uniti nel Dipartimento di Geoscienze (DIGE).

Stazione mareografica di Trieste - Porto Lido

DATI 2010

Università di Trieste,
Dipartimento di Geoscienze
Sezione di Oceanografia e Meteorologia.

RIASSUNTO. Sono pubblicati i dati orari del livello del mare ed i dati medi ed estremi giornalieri del livello del mare, della temperatura dell'aria e della temperatura del mare (in superficie ed a 2 m di profondità) rilevati alla stazione mareografica di Trieste - Porto Lido durante il 2010.

La stazione mareografica

La stazione mareografica di Trieste - Porto Lido (ED: 45°38'55" N, 13°45'18" E; WGS84: 45°38'57.14" N, 13°45'16.70 E; fig. 1, 2) è stata installata dall'Istituto di Geodesia e Geofisica nel 1995 presso la sede a mare dell'Istituto Tecnico Nautico di Trieste (Stravisi e Purga, 1997; Stravisi 1998). Sull'orlo del molo, presso il mareografo, è posto un caposaldo integrato nella rete nazionale di levellazione con la sigla CjD1/2-CO (fig. 2); un caposaldo verticale (CjD1/2-CO') è riportato sul palo di sostegno dei tubi idrometrici.

I sensori impiegati sono elencati nella tab. 1. Il mareografo principale è un OTT Thalimedes a galleggiante, dotato di encoder e data logger, operativo dal 19 marzo 2003. Il sensore di livello Micros SLU1 ad onde sonore è tenuto ancora in funzione come riserva. I dati di livello sono controllati periodicamente mediante misure dirette.

La tab. 2 riassume la situazione dei riferimenti altimetrici.

| parametro | simbolo | sensore | quota /m | precisione |
|----------------------------------|----------------------|------------------|------------|------------|
| <i>livello del mare</i> | <i>L</i> | Ott Thalimedes | 3.2 | 1 mm |
| <i>livello del mare</i> | <i>S</i> | Micros SLU1 | 4.5 | 1 mm |
| <i>temperatura di SLU1</i> | θ_S | Pt100 | 4.5 | 0.01 °C |
| <i>temperatura del mare</i> | θ_0, θ_2 | Micros Pt100 | -0.3, -2.0 | 0.01 °C |
| <i>pressione atmosferica</i> | <i>p</i> | Vaisala PTA 427 | 3.13 | 1 Pa |
| <i>temperatura del barometro</i> | θ_B | LM35CZ | 3.13 | 0.01 °C |
| <i>temperatura dell'aria</i> | θ | Micros Pt100 | 4.0 | 0.01 °C |
| <i>umidità relativa</i> | <i>U</i> | Vaisala Humitter | 4.0 | 0.1 % |

Correzione dei dati di livello

Il mareografo OTT, soggetto ad eventuali spostamenti dello zero dovuti a scivolamento del cavo, di norma contenuti entro ± 2 mm, è stato periodicamente controllato ed aggiustato con misure dirette del livello nel tubo mareografico. La serie è omogenea e completa per tutto il 2010; i dati, riferiti a P_0 , hanno la precisione di 1 mm ed un’accuratezza migliore di 5 mm. Per ragioni di economia è stato adottato un intervallo di acquisizione di due minuti; per il calcolo degli estremi relativi, i dati ad 1 min sono stati interpolati per mezzo di funzioni “spline” cubiche.

Il sistema di acquisizione dati Micros è rimasto regolarmente in funzione con le stesse modalità degli anni precedenti. I sensori sono interrogati con continuità; ogni 10 minuti vengono memorizzati i valori medi della pressione, della temperatura (dell’aria, del mare in superficie, del mare a 2 m, del sensore di livello e del sensore di pressione) e dell’umidità relativa, ed il livello medio dell’ultimo minuto. La vecchia centralina è stata cambiata con una Micros DA7000.

La temperatura del mare è misurata a 10 m dalla riva in superficie (0.3 m, θ_0) ed a 2 m di profondità (θ_2). I sensori di temperatura e umidità dell’aria sono posti sul palo di sostegno del mareografo. Il barometro è collocato internamente alla centralina di acquisizione dati Micros. I dati di pressione e umidità dell’aria rilevati presso la stazione mareografica non sono qui pubblicati: si faccia riferimento ai corrispondenti dati della stazione meteorologica di Trieste.

Tabelle e grafici

Tabelle mensili con i dati orari di livello. L'ora riportata nella prima riga corrisponde al *tempo medio dell'Europa centrale* (TMEC = GMT + 1 h = CET). I dati di livello (3) sono espressi in millimetri e riferiti al *piano zero* (2). L'ultima riga riporta il ciclo giornaliero medio del mese.

Tabelle mensili con i dati giornalieri medi ed estremi del livello. La giornata inizia alle ore 00:00 CET. Le medie giornaliere (med) sono calcolate con i 1440 valori con passo temporale di 1 min; sono inoltre riportati i livelli giornalieri estremi (min, max) con i corrispondenti istanti (*ora*) e l'escursione giornaliera (esc). I livelli, espressi in centimetri, sono riferiti a P₀.

Tabelle mensili con i dati giornalieri medi ed estremi delle temperature. Riportano i dati giornalieri medi (med) ed estremi (min, max) della temperatura dell'aria e del mare e le corrispondenti escursioni (esc).

Riassunto annuale. La tabella riporta, per il livello del mare e per le temperature, i valori medi mensili (med), le medie mensili degli estremi giornalieri (min, max), le medie mensili delle escursioni giornaliere (esc) e gli estremi assoluti del mese (MIN, MAX).

Grafici. Rappresentano la serie temporale completa del livello del mare (passo 1 min) e la corrispondente *marea meteorologica* (differenza tra il livello osservato e la marea astronomica). La marea astronomica è stata calcolata come somma di sette componenti armoniche ($m = 1,7$) :

$$\eta_m = f_m(t) H_m \cos(V_m(t) + u_m(t) - g_m) ;$$

i fattori nodali f e gli argomenti $V+u$ (Stravisi, 1989) sono stati calcolati in funzione del tempo senza la consueta approssimazione lineare. Le costanti armoniche sono le medie dei valori relativi agli anni 1941-1961 e 1975-1996 ottenuti con il metodo dei minimi quadrati (tab. 3).

| | M ₂ | S ₂ | N ₂ | K ₂ | K ₁ | O ₁ | P ₁ |
|-------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
| H /cm | 26.7 | 15.9 | 4.5 | 4.8 | 18.0 | 5.3 | 6.0 |
| g | 277.0° | 284.9° | 275.7° | 280.2° | 71.3° | 60.8° | 67.3° |

Tab. 3.- Costanti armoniche di Trieste.

Gli ultimi due grafici riportano, per tutto l'anno, l'andamento dei valori medi giornalieri della pressione atmosferica al livello del mare, della marea meteorologica, della temperatura dell'aria e del mare a 2 m e della differenza tra la temperatura del mare in superficie e a 2 m di profondità. Livello e pressione sono ben correlati; la pendenza della retta di regressione tra i corrispondenti valori medi giornalieri del 2010 è di -1.32 cm/hPa.
