La stazione meteorologica di Padriciano – AREA Dati 1993 – 2010

Franco Stravisi, Nicolò Purga, Stefano Cirilli
Università di Trieste, Dipartimento di Geoscienze

RIASSUNTO. Sono descritti gli strumenti e le modalità di acquisizione, validazione ed archiviazione dei dati della stazione meteorologica situata all'Area Science Park di Padriciano (Trieste). Sono inoltre pubblicati i dati giornalieri relativi alla pressione atmosferica, alla temperatura dell'aria, all'umidità relativa ed alle precipitazioni per gli anni dal 1993 al 2010.

ABSTRACT. The meteorological station at the Area Science Park (Padriciano, Trieste, Italy) is described: instruments and methods of data acquisition, validation and filing. Air pressure, temperature, relative humidity and precipitation data are reported as monthly tables with daily values, annual tables with monthly values and global summaries.

La stazione meteorologica

Nel 1991, su iniziativa dell'Università di Trieste e del CETA (*Centro di Ecologia Teorica e Applicata*) di Gorizia è partito un progetto biennale, finanziato dall'Area Science Park di Padriciano (Trieste), per lo studio delle caratteristiche climatiche di quella parte del Carso triestino. Allo scopo è stata acquistata una stazione meteorologica di nuova generazione (per l'epoca), dotata di un'unità di acquisizione dati, schede interfaccia e sensori. Le apparecchiature (della ditta Micros srl) sono dello stesso tipo di quelle già in uso presso il *Laboratorio di Climatologia* (LC), allora costituito presso il *Dipartimento di Fisica Teorica dell'Università di Trieste* e l'ICTP (*Centro Internazionale di Fisica Teorica*) (Stravisi, 1989a,b) e di quelle adottate per la stazione meteorologica principale di Trieste nel sito storico di piazza Hortis. La stazione è stata inizialmente installata (fine 1991) a Basovizza, nel vivaio del Corpo Forestale, accanto alla vecchia stazione dell'Ufficio Idrografico del Magistrato alle Acque ed a quella dell'Istituto Sperimentale Talassografico di Trieste, allo scopo di poter effettuare gli opportuni confronti con i sistemi tradizionali di monitoraggio.

Nel 1992 le apparecchiature sono state spostate ed installate, a cura dello stesso LC e con l'aiuto dei servizi tecnici dell'AREA, nella posizione attuale sul tetto dell'edificio "B" nel comprensorio di Padriciano (45°39'27" N, 13°49'45" E; fig. 1,2). La posizione scelta è stata un compromesso dettato da esigenze logistiche e di protezione degli strumenti; la collocazione dei sensori termoigrometrici, sulla terrazza dell'edificio a 13.2 m dal suolo, non è pertanto quella standard WMO. Si è comunque provveduto a sistemarli esternamente alla terrazza, sul lato nord, per minimizzare l'influenza termica dell'edificio. Il pluviometro è al centro del terrazzo (fig. 3, 4); La centralina ed il modem telefonico, inizialmente all'esterno, sono stati poi sistemati in una stanza adiacente, sul tetto della quale è fissato un palo con l'anemometro ed il piranometro. Il termometro (Micros STEP), del tipo Pt100 con collegamento a quattro fili, è stato preventivamente tarato in laboratorio; da allora è rimasto invariato. Il sensore di umidità relativa, di tipo capacitivo, inizialmente un Micros SRH, è stato presto sostituito con un Vaisala Humitter più affidabile. Il barometro (Micros BAR) è stato tarato in laboratorio per confronto con un barometro campione a mercurio. Il pluviometro (Micros PLUVR) è quello classico a vaschette basculanti, con superficie di raccolta incrementata a 1000 cm² e risoluzione di 0.1 mm; all'occorrenza è riscaldato da un alimentatore con termostato. I dati dell'anemometro (Micros SVDV) e del piranometro a stella Schenk non sono stati considerati in questo rapporto. I dati

sono memorizzati sia su memorie a stato solido (Micros CBM) leggibili in loco che su analoghe memorie (Micros CIC) collegate ad un modem telefonico.

Nel novembre 1992 il Laboratorio di Climatologia, trasferito presso la sede di via Ottaviano Augusto, è diventato la *sezione di Oceanografia e Meteorologia* (OM) dell'Istituto di Geodesia e Geofisica (IGG) dell'Università di Trieste. Nel 1996 l'IGG e l'Istituto di Mineralogia e Petrografia hanno formato il Dipartimento di Scienze della Terra (DST), con una nuova sede in via Weiss nel comprensorio di S. Giovanni. Infine, con il 2010, DST e Dipartimento di Scienze Geologiche, Ambientali e Marine si sono riuniti nel Dipartimento di Geoscienze (DIGE). Nel frattempo la sezione OM ha continuato a suo carico la regolare gestione della stazione meteorologica di Padriciano-AREA.

Trattamento dei dati

La procedura è la stessa a suo tempo adottata per le altre stazioni dello stesso tipo. Le operazioni sono effettuate dalla centralina di acquisizione (in pratica un elaboratore programmabile con linguaggio Basic, implementato da alcune istruzioni proprie della Micros) che esegue automaticamente dei programmi appositamente scritti (Stravisi, 1989b, 1995). Un ciclo completo di lettura dei sensori e dei calcoli relativi impiega circa 30 secondi; si è scelto di memorizzare le medie aritmetiche dei diversi parametri su intervalli successivi di 10 minuti. Il tempo adottato è l'ora "solare" del fuso locale (CET o GMT + 1h): per ovvi motivi di continuità non si tiene conto dell'ora legale estiva, quando in vigore. Ogni giornata quindi, dalle ore 00:00 alle 24:00, è divisa in 144 intervalli di 10 min, ed i valori estremi giornalieri di ciascun parametro sono rispettivamente il minimo ed il massimo di questi valori. Il tempo di memorizzazione di 10 min è stato scelto sia per motivi pratici (le memorie di allora riuscivano così a contenere un mese abbondante di dati) che di continuità storica, in quanto corrispondente al tempo di risposta degli strumenti meccanici convenzionali.

Pressione atmosferica. Sono stati impiegati due barometri (Micros BAR n. 165 e n.274), collocati alternativamente uno presso la stazione e l'altro in laboratorio per il confronto con i barometri a mercurio di riferimento. Questo tipo di sensore è soggetto ad un errore che in buona approssimazione è una funzione lineare della pressione e della temperatura dello strumento; i coefficienti di amplificazione sono facilmente determinabili per confronto con le misure di riferimento ed abbastanza stabili nel tempo, mentre la costante presenta una deriva irregolare che nel corso degli anni può raggiungere valori di alcuni ettopascal. Le misure del sensore Micros sono state corrette linearmente secondo la taratura di laboratorio al momento della messa in opera. La costante è stata determinata a posteriori per confronto tra la serie registrata all'AREA e la corrispondente serie di Trieste, registrata con barometri digitali Vaisala PTB200 ed accurata a ± 3 Pa (Stravisi, 1994-2010). Il procedimento è il seguente:

1. la serie di Trieste (dati medi ogni 10 min) è stata ridotta alla quota del barometro dell'AREA (383 m) in funzione dei corrispondenti valori di temperatura e di umidità relativa dell'aria (Stravisi 1994b);
2. sono state determinate le differenze tra questa serie di riferimento e la serie barometrica registrata all'AREA;
3. la serie delle differenze, trascurati i valori corrispondenti a velocità del vento maggiore di 6 m/s che rendono non applicabile per l'atmosfera l'equazione verticale idrostatica, è stata trattata con un filtro settimanale;
4. le correzioni così ottenute sono state applicate ai dati barometrici dell'AREA.

Temperatura ed umidità. Il termometro (Pt100), tarato in laboratorio nel 1991 per confronto con un termometro campione, non ha subito da allora cambiamenti, nè di sensore nè di collegamento; periodicamente è stato controllato con uno psicrometro ad aspirazione assieme all'igrometro. Nel 2010 è stato posto in opera, nello stesso schermo, un datalogger Lascar EL-USB-2, a sua volta tarato in laboratorio, che memorizza indipendentemente ed in parallelo i dati di temperatura e di umidità relativa. In base al confronto, il Pt 100 si è così dimostrato stabile nel tempo entro i limiti di precisione richiesti (± 0.1 °C). Le deriv e dell'igrometro sono state corrette al meglio, riportando i valori massimi di saturazione a 99% ed le altre registrazioni alle misure disponibili.

Precipitazioni. Il pluviometro a vaschette oscillanti presenta ad ogni scatto un tipico errore che in genere aumenta con l'intensità della precipitazione e può arrivare facilmente al 15%. Sono stati inoltre riscontrati, in installazioni sperimentali standard su palo, ribaltamenti spuri delle vaschette anche in assenza di pioggia, dovuti a vibrazioni dello strumento provocate da forti raffiche di vento; il metodo da noi adottato per impedire questo inconveniente è di fissare il pluviometro su di un supporto rigido, di solito un treppiede appositamente costruito (fig. 4).

L'esattezza delle misure è garantita dal confronto con il volume dell'acqua raccolta allo scarico del pluviometro; in questo caso bisogna verificare che le vaschette si svuotino solo e completamente negli appositi imbuti e che l'acqua sia correttamente convogliata al recipiente. Le misure di controllo sono state eseguite a cadenza mensile, contemporaneamente alla lettura dei dati memorizzati eseguita con un PC portatile. Per la correzione dei dati si è usato un apposito programma in Fortran.

Le serie 1993-2010

Le registrazioni della stazione di Padriciano-AREA sono iniziate a metà giugno 1992; alla fine del 2010 è iniziato un programma di graduale rinnovamento degli strumenti.

Le serie di pressione, temperatura, umidità relativa e precipitazioni presentate in questo rapporto sono continue, senza interruzioni. Presentiamo di seguito i dati delle annate complete 1993-2010:

- *tabelle mensili* con i dati giornalieri medi ed estremi (ore 00:00-24:00 CET) e le escursioni giornaliere ($esc = max-min$) di pressione, temperatura, umidità, e le precipitazioni giornaliere totali. Le righe finali riportano le corrispondenti medie, estremi, totale;
- *tabelle annuali* con i dati mensili. Per la pressione, temperatura ed umidità: media, escursione giornaliera media, medie degli estremi giornalieri, estremi assoluti; altezza totale mensile delle precipitazioni;
- *tabelle riassuntive* del periodo (anno medio 1993-2010) e dell'ultimo decennio normale (2001-2010).

I corrispondenti dati della stazione campione di Trieste si trovano nei rapporti elencati nei riferimenti.
