La stazione meteorologica di Padriciano – AREA Dati 2011-2016

Stefano Cirilli, Tullio Quaia & Franco Stravisi[†]
Università di Trieste, Dipartimento di Matematica e Geoscienze

RIASSUNTO. Sono descritti gli strumenti e le modalità di acquisizione, validazione e archiviazione dei dati della stazione meteorologica situata all'Area Science Park di Padriciano (Trieste). Sono inoltre pubblicati i dati giornalieri, mensili e annui relativi alla pressione atmosferica, alla temperatura dell'aria, all'umidità relativa e alle precipitazioni per gli anni dal 2011 al 2016.

ABSTRACT. The meteorological station at the Area Science Park (Padriciano, Trieste, Italy) is described: instruments and methods of data acquisition, validation and filing. Air pressure, temperature, relative humidity and precipitation data for the years 2011-2016 are reported as monthly tables with daily values, annual tables with monthly values and global summaries.

La stazione meteorologica: cronistoria e strumentazione

La stazione Micros

Nel 1991, su iniziativa dell'Università di Trieste e del CETA (Centro di Ecologia Teorica e Applicata) di Gorizia, era partito un progetto biennale finanziato dall'AREA Science Park di Padriciano (Trieste) finalizzato allo studio delle caratteristiche climatiche di quella parte del Carso triestino. A tale scopo era stata acquistata una stazione meteorologica dotata di un'unità di acquisizione dati, schede interfaccia e sensori della ditta Micros s.r.l. dello stesso tipo di quelle in uso presso il *Laboratorio di Climatologia* (LC) – poi divenuto *sezione di Oceanografia e Meteorologia* (OM) – allora costituito presso il Dipartimento di Fisica Teorica dell'Università di Trieste e l'ICTP (Centro Internazionale di Fisica Teorica) (Stravisi, 1989a,b), e di quelle adottate per la stazione meteorologica principale di Trieste nel sito storico di piazza Hortis. La stazione Micros, inizialmente installata per un breve periodo di intercalibrazione a Basovizza, nel vivaio del Corpo Forestale, accanto alla vecchia stazione dell'Ufficio Idrografico del Magistrato alle Acque e a quella dell'Istituto Sperimentale Talassografico di Trieste, nel giugno del 1992 era stata quindi spostata nella sua sede definitiva a Padriciano, sul tetto dell'edificio 'B' del comprensorio dell'AREA ($45^{\circ}39'27''$ N, $13^{\circ}49'45''$ E; figg. 1,2). La posizione scelta, sulla terrazza di un edificio a 13.2 m dal suolo, pur non risultando completamente conforme agli standard WMO, era stata un compromesso dettato da esigenze tecnico-logistiche; l'installazione dei sensori di temperatura e umidità relativa dell'aria sul lato nord dell'edificio 'B', su un supporto fissato esternamente alla terrazza, ha consentito tuttavia di minimizzare l'influenza termica dell'edificio stesso (fig. 3).

La centralina di acquisizione e il modem, dapprima posizionati all'esterno dell'edificio, sono stati successivamente sistemati in un locale interno, alla cui facciata esterna è stato fissato un palo sul quale sono stati installati l'anemometro e il piranometro. Il pluviometro è stato collocato al centro del terrazzo (fig. 4).

Il barometro, un Micros BAR, è stato inizialmente tarato in laboratorio per confronto con un barometro campione a mercurio. Il termometro è un Micros STEP

del tipo Pt100 con collegamento a quattro fili, anch'esso preventivamente tarato in laboratorio e da allora rimasto invariato. Il sensore di umidità relativa è un Vaisala Humitter, che ha presto sostituito l'igrometro Micros SRH di tipo capacitivo di prima installazione, ritenuto meno affidabile. Il pluviometro Micros PLUVR è del tipo riscaldato a vaschette basculanti, con superficie di raccolta incrementata a 1000 cm² e risoluzione di 0.1 mm. I dati dell'anemometro (Micros SVDV) e del piranometro a stella Schenk non sono stati riportati nel rapporto precedente di Stravisi *et al.* (2011), né vengono considerati in questo.

Per la descrizione tecnica di dettaglio della strumentazione e le procedure di taratura utilizzate si faccia riferimento al rapporto sopra citato.

La stazione Nesa

Alla fine del 2010, un programma di graduale rinnovamento della strumentazione meteorologica in uso alla sezione OM dell'allora Dipartimento di Geoscienze (DiGe) dell'Università degli Studi di Trieste – poi accorpatisi nel 2012 con il Dipartimento di Matematica a formare l'attuale *Dipartimento di Matematica e Geoscienze* (DMG) – ha condotto, nella primavera del 2011, alla sostituzione pressoché completa della vecchia stazione meteorologica Micros da parte di AREA.

Il 31 maggio 2011 alle ore 8:30 la stazione Micros è stata disattivata e alle ore 16:00 dello stesso giorno è entrata in funzione una stazione della Nesa s.r.l., di ultima generazione, gestita da un *datalogger* Nesa mod. AND-TMF100 s/n 1003477 (fig. 5), dotato di sistema operativo Linux *web-oriented* programmabile e in grado di comunicare in tempo reale con il server attraverso Internet. La centralina di acquisizione Nesa è dotata di moduli M2Ch di protezione dalle scariche atmosferiche.

I vecchi sensori Micros di temperatura e umidità dell'aria sono stati mantenuti per confronto sul medesimo supporto e nella medesima posizione scelta all'atto della prima installazione della stazione Micros, e affiancati a un nuovo sensore termo-igrometrico combinato Nesa ANS-UTA-N, s/n 1006338, posto a qualche metro di distanza su uno sbraccio esterno alla terrazza sempre per minimizzare l'influenza termica del tetto (fig. 6). Il sensore di pressione atmosferica è un Nesa ANS-BAR-A, s/n 1003483, il cui range di acquisizione è compreso tra 800 e 1100 hPa. L'anemometro (fig. 7) è composto da un sensore di direzione vento Nesa ANS-DV-A, s/n 1003479, e da un sensore di velocità Nesa ANS-VV-N, s/n 1003480, operante nell'intervallo 0-50 m/s. Il sensore di radiazione solare globale (Fig. 7) è un ANS-RSG-N, s/n 1003481, con un range di acquisizione che va da 0 a 1300 W/m². Il pluviometro (fig. 8) è un ANS-PL1000-N a vaschette basculanti, s/n 1003482, in grado di misurare precipitazioni di intensità comprese tra 0 e 300 mm/h con una risoluzione di 0.2 mm.

I dati memorizzati dal *datalogger* vengono inviati tramite protocollo FTP ai server di www.meteo.units.it, dove vengono memorizzati su database MySQL e pubblicati in tempo reale su pagine web dedicate. Contestualmente, gli stessi dati vengono letti da apposite procedure informatiche predisposte da AREA, per essere pubblicati anche sul portale dell'AREA Science Park.

A fine luglio 2016, causa lavori di ristrutturazione dell'edificio 'B', la stazione meteorologica ha smesso di funzionare, in seguito allo stacco dell'alimentazione per motivi di sicurezza. Si presume che tutta la strumentazione resterà inattiva almeno fino al termine dei lavori.

Trattamento dei dati

I dati barometrici, termoigrometrici e pluviometrici del periodo 2011-2016 riportati nel presente rapporto sono stati acquisiti dal 1° gennaio al 31 maggio 2011 dalla stazione Micros e dal 31 maggio 2011 in poi dalla stazione Nesa, ed elaborati dai server della sezione OM del DMG (già DiGe fino al 2012) dell'Università degli Studi di Trieste, che nell'ambito di una specifica convenzione stipulata con l'AREA Science Park ha anche curato la validazione degli stessi dati e la manutenzione della stazione meteorologica.

Le procedure sono le stesse in uso per le altre stazioni gestite dalla sezione OM. La centralina di acquisizione (*datalogger*) memorizza i dati a intervalli di 10 minuti; il tempo adottato è l'ora "solare" del fuso locale (CET o GMT + 1h). Per ovvi motivi non si tiene conto dell'ora legale, quando in vigore. Ogni giornata, dalle ore 00:00 alle 24:00, risulta quindi suddivisa in 144 intervalli di 10 min ciascuno.

Il sistema Micros, rimasto in funzione dal 1991 al maggio del 2011, era stato programmato per effettuare un ciclo completo di lettura dei sensori ogni 30 secondi e per calcolare e archiviare le medie aritmetiche di ciascun parametro ogni 10 minuti, con l'ovvia eccezione del dato pluviometrico che tipicamente indica invece la quantità di pioggia accumulata nei 10 min considerati. Le medie e gli estremi giornalieri rappresentano rispettivamente la media aritmetica e il valore minimo e massimo dei dati memorizzati ai 10 minuti. Anche in questo caso il dato pluviometrico rappresenta invece un totale, e corrisponde all'altezza totale delle precipitazioni accumulate nel periodo considerato.

A partire dal 31 maggio 2011 è entrato in funzione il nuovo *datalogger* Nesa mod. AND-TMF100, che acquisisce i dati letti dai sensori meteorologici ogni 3 secondi e ne memorizza i corrispondenti valori medi (cumulati, per le precipitazioni), minimi e massimi ogni 10 minuti. Per ciascun parametro vengono calcolati la media giornaliera, corrispondente alla media aritmetica dei valori registrati ai 10 min (o l'altezza della precipitazione accumulata), e gli estremi giornalieri, che corrispondono al minimo e al massimo dei valori misurati ai 10 min, in assoluta continuità con le serie degli anni precedenti (1993-2000) (cfr. Stravisi *et al.*, 2011).

Pressione atmosferica. Fino al 31 maggio 2011, data in cui la vecchia stazione meteorologica della Micros è stata dismessa e sostituita con quella della Nesa, i dati di pressione sono stati acquisiti dal barometro Micros BAR n. 165. A partire dalla stessa data, le letture barometriche vengono effettuate dal nuovo barometro Nesa ANS-BAR-A s/n 1003483.

Temperatura e umidità. Per l'intero dataset 2011-2016 i valori della temperatura sono misurati con il vecchio termometro Micros STEP, del tipo Pt100, installato esternamente alla terrazza dell'edificio 'B' nel 1992, dimostratosi stabile nel tempo entro i limiti di precisione richiesti dallo strumento ($\pm 0.1^\circ\text{C}$) e da allora rimasto sostanzialmente immutato, eccezion fatta per il collegamento al nuovo *datalogger* Nesa. Anche i dati di umidità relativa sono quelli acquisiti dal vecchio igrometro Vaisala Humitter, in funzione dal 1992. Le letture del nuovo termoigrometro Nesa ANS-UTA-N s/n 1006338 non vengono qui considerate, preferendo fare riferimento ai vecchi sensori per assicurare la miglior continuità possibile con le serie precedenti. Analogamente a quanto effettuato negli anni precedenti, anche per il periodo 2011-2016 le derive strumentali dell'igrometro sono state corrette su base annua, riportando i valori massimi di saturazione al 99% e ricalcolando proporzionalmente tutte le letture.

Precipitazioni. Il pluviometro a vaschette basculanti Micros PLUVR installato nel 1992 e rimasto in uso fino al 31 maggio 2011, pur risultando in teoria preciso agli 0.1 mm di pioggia (corrispondenti a 10 ml di volume della bascula) presenta un margine di errore che tipicamente può raggiungere anche il 15%. L'esattezza delle misure su questo intervallo temporale è stata garantita dal confronto con il volume dell'acqua raccolta allo scarico del pluviometro, eseguito a cadenza mensile, in continuità con quanto effettuato negli anni precedenti. Non è stato invece più possibile svolgere questo tipo di verifica sulle letture pluviometriche ottenute a partire dal 31 maggio 2011 con il nuovo pluviometro Nesa ANS-PL1000-N a vaschette basculanti s/n 1003482, in quanto del tipo 'a perdere', ossia sprovvisto di un sistema di raccolta delle precipitazioni. La congruità delle letture è stata comunque verificata per confronto con le serie pluviometriche registrate dalla vicina stazione meteorologica di Basovizza, installata ed equipaggiata dal DiGe/DMG con un'analogia strumentazione, e operativa dal 25 ottobre 2011.

Le serie 2011-2016

Le registrazioni della stazione di Padriciano-AREA sono iniziate a metà giugno 1992.

Le serie di pressione, temperatura, umidità relativa e precipitazioni delle annate complete 1993-2010 riportate nel rapporto di Stravisi *et al.* (2011), ed alle quali si rimanda per gli eventuali confronti, sono state tutte acquisite dalla medesima stazione meteorologica Micros.

Le serie relative al periodo 2011-2016 che vengono presentate in questo rapporto sono state invece acquisite, come ricordato più volte, da due stazioni meteorologiche differenti in due periodi differenti:

- un primo breve periodo, quello monitorato dalla stazione Micros, che va dal 1° gennaio 2011 al 31 maggio 2011, data di dismissione della stessa;
- un secondo periodo, quello riferito alla nuova stazione Nesa, che va dal 31 maggio 2011 fino al 29 luglio 2016, date rispettivamente di attivazione e di spegnimento della stazione.

Durante il primo periodo le serie di pressione, temperatura, umidità relativa e precipitazioni risultano perfettamente contigue a quelle degli anni precedenti, in quanto registrate con la medesima strumentazione. Durante il secondo periodo la continuità è garantita per le serie di temperatura e umidità, avendo acquisito i dati sia con i vecchi che con i nuovi sensori, mentre per le serie barometriche e pluviometriche non si è potuto disporre di un periodo di comparazione tra la nuova e la vecchia strumentazione, che è stata dismessa poiché obsoleta e ormai inutilizzabile; per la validazione dei dati di pressione e piovosità si sono utilizzate le registrazioni della vicina stazione di Basovizza.

Sono qui di seguito i dati di Padriciano-AREA degli anni 2011-2016 nella seguente forma:

- *tabelle mensili* con i dati giornalieri medi ed estremi (ore 00:00-24:00 CET) e le escursioni giornaliere ($\text{esc} = \max - \min$) di pressione, temperatura, umidità, e le precipitazioni giornaliere totali. Le righe finali riportano le corrispondenti medie, gli estremi, il totale;

- *tabelle annuali* con i dati mensili. Per la pressione, temperatura e umidità: media, escursione giornaliera media, medie degli estremi giornalieri, estremi assoluti; altezza totale mensile delle precipitazioni;
- *tabelle riassuntive* del periodo (anno medio 2011-2016) e dell'ultimo decennio normale (2001-2010).

Per quanto riguarda le tabelle annuali, si noti che nell'anno 2016 le medie del periodo (segnalato in tabella con un asterisco) si riferiscono non all'anno intero bensì al solo periodo gennaio-luglio, causa cessazione delle registrazioni a seguito dello spegnimento della stazione.

I corrispondenti dati della stazione campione di Trieste per gli anni 2011-2016 si trovano nei rapporti elencati nei riferimenti.

Ringraziamenti. Ringraziamo la famiglia Stravisi per aver reso possibile, con il finanziamento del Premio di Ricerca ‘*Franco Stravisi*’ istituito nel 2016 presso l’Ateneo triestino, la prosecuzione di questa linea di ricerca, iniziata negli anni ’80 dal compianto Professor Stravisi e da lui coordinata sempre con competenza, dedizione e appassionato entusiasmo fino alla sua prematura scomparsa. E’ alla sua memoria che dedichiamo, riconoscenti, questo lavoro.
