Apart from some technical interventions, the texts have not been altered. In a few
exceptions only, some corrections have been made, which have not affected the meaning
of the text.

Eating disorders and personality correlates in men:

A validity study of the Eating Disorder Assessment for Men (EDAM) in the Italian language.

Marco Folla
Elide Francesca De Caro
Lisa Di Blas
University of Trieste

Personality and eating disorders are associated in women, less is known however about how they are associated in men. The present study aimed at validating the Eating Disorder Assessment for Men (EDAM, Stanford & Lemberg, 2012) in the Italian language and exploring its correlates with personality variables. A non-clinical sample of Italian men (M_Age = 39.0) provided self-ratings along EDAM and the HEXACO-PI and SD3 personality questionnaires. Principal component analysis of EDAM items suggested 5 content-coherent dimensions: Vigorexia, Compensatory strategies, Body satisfaction, Overeating, and Drive for thinness. They did not fully replicate the expected structure. Regression analysis showed distinctive personality-EDAM domain associations, with Vigorexia positively correlating with SD3 Machiavellism, Compensatory strategies being positively associated with SD3 Narcissism, lower Control over eating with lower HEXACO-PI Conscientiousness, and higher Drive for thinness with lower Extraversion. Results are discussed in relation to gender differences in eating disordered symptoms and correlates with personality variables.
